Creating new articles

There are several ways to create a new article.

In general, however, you should first check whether the article already exists. Search therefore for the term and also for synonyms. If the search has no search result, you can create the page.

First some hints:

- To create an article in a different namespace, you must write the namespace before the article name, for example `[[NewNamespace: First_Article]]>`.
- After entering the page title, a menu will appear which contains the wiki's specific **PageTemplates**.
- The following symbols "cannot" be used in titles: `: { } & ? < > \ und ,`
- The symbol `/` should only be used when you are creating a subpage **Unterseite** (Subpage).

Vorlagen verwenden

It does not matter which of the methods described below you use, you will always be forwarded to an overview page where you can choose from different templates (if they are available) **Templates**. If you do not want to use a template, click on empty page or directly on "create".

You will then be able to write content to the page. As soon as it is saved, the article exists.

Einen Artikel über die Suche anlegen

First, search for a term or content using the search function. Also try searching for synonyms and similar terms. If your search returns no hits, then you can click on "create", directly below the search box. You are then

forwarded to the page to be created.

Create a new article via URL

Just like creating a page via a link in some text, you can also just enter the URL. To do this, go to your browser's address bar. You will see something like **https://docs.maxcrc.de/wiki** Add a slash and the page name after this, and press the return key. You will automatically be forwarded to the start form for the new page..

Create a new article via a link in the text

A classical way to create articles in MediaWiki is by using "Red links". These are links in the text to the article to be created, and clicking on these creates the page. This means that the wiki pages are immediately linked to each other.

Suppose we want to, for example, create the article "Training". It is not absolutely necessary, but it is useful to have this new page linked to other pages in the wiki. To create this connection, generate a reference to the page "Training". This is done by changing to the edit mode. Then add the following to a page of your choosing:

```
[[Training]]
```

The double square brackets cause the phrase "Training" to be interpreted as a link interpreted by the wiki software as a reference to the "Training" page. Since the page does not exist yet, it is colored red. If you switch to "Training" with just one click, the edit view automatically appears. Here you can enter any text again. After you have saved, you will see the newly created page.

Dazu bietet Hallo Welt **Trainings** an.

Screenshot:Redlink, where the new page will be created

A redlink is thus a link that has already been created, but whose landing page does not yet contain any content. The article basically does not exist yet, that is, it is not displayed in the search, but it is listed in the **Desired Pages**. "Redlinks" articles are created classically in MediaWiki. Here are new pages about '*page links in the text*'. This links the wiki pages with each other. 'Active links' to existing pages are, by the way, colored '*blue*' .

Create a new article in a namespace

New articles/pages in a namespace can be created by using the "Create new page" form simply by creating an article whose address starts with the namespace, for example "Help:New Article".

Tips for creating pages

- Try "not to use the back button" whenever possible. Many browsers use the page cache to lower loading times, so you may be given an older version of the page. The worst case scenario is that the browser resends data from the edit form from the edit view, which could overwrite newer changes.

HINWEIS

Sind Sie der Meinung, dass ein Artikeltitel häufiger mit einem anderen Synonym gesucht wird? Dann legen Sie zunächst einen neuen Artikel mit diesem Namen an und arbeiten Sie dann mit einer **Weiterleitung**.

- Der **Wahl eines geeigneten Titels** kommt eine große Bedeutung zu. Gerade in Wikis mit vielen Einträgen kommt es häufig vor, dass Autoren "auf gut Glück" Verweise auf Seiten setzen, die sie im Zusammenhang ihres Eintrags für wichtig erachten. Es sollte also darauf geachtet werden, dass der Titel möglichst knapp und genau bezeichnet, um was es auf der Seite geht. Einzelne Worte eignen sich sehr gut, aber auch kurze Sätze wie "warum Wikis funktionieren" können brauchbare Namen sein. Darüber hinaus erleichtern aussagekräftige Seitentitel auch den Lesern die Orientierung und die Suche nach einem Eintrag.
- Bei der Verlinkung zu einer bereits bestehenden Seite, sollten Sie auf deren genaue **Schreibweise** achten. Wenn Sie z.B. ein [[hello world]] statt [[Hello World]] eingeben, entsteht wieder eine neue Seite, da die Links unterschiedlich geschrieben wurden. Berücksichtigen Sie daher auch Groß-/Kleinschreibung und Leerzeichen. Lediglich beim Anfangsbuchstaben macht es keinen Unterschied, ob Sie diesen groß oder klein schreiben.
